

Securing Device For Cargo Restraining Apparatus

Abstract

5 A device for securing cargo restraining apparatus on a wall of a cargo
receptacle is comprised of a body member adapted for slidable engagement with an
elongated track on the wall; an attachment member for attaching the body member
to the cargo restraining apparatus; and first and second trigger members at respective
opposed ends of the body member. The first and second trigger members are adapted
10 to engage respective complementary portions of the track to inhibit sliding movement
of the body member along the track when both of the first and second trigger
members are engaged with the track, such that the body member is slidable only in
one direction when the first trigger member is disengaged from the track and the
second trigger member is engaged with the track and is slidable only in an opposite
15 direction when the second trigger member is disengaged from the track and the first
trigger member is engaged with the track. The first and second trigger members have
respective beveled surfaces to facilitate disengagement of the first and second trigger
members from the track.
